

Module 12

Advanced Query Formulation with SQL

Lesson 4 (Part 2): Containment Exceptions in the SELECT statement

Lesson Objectives

Define containment exception as related to the relational division operator

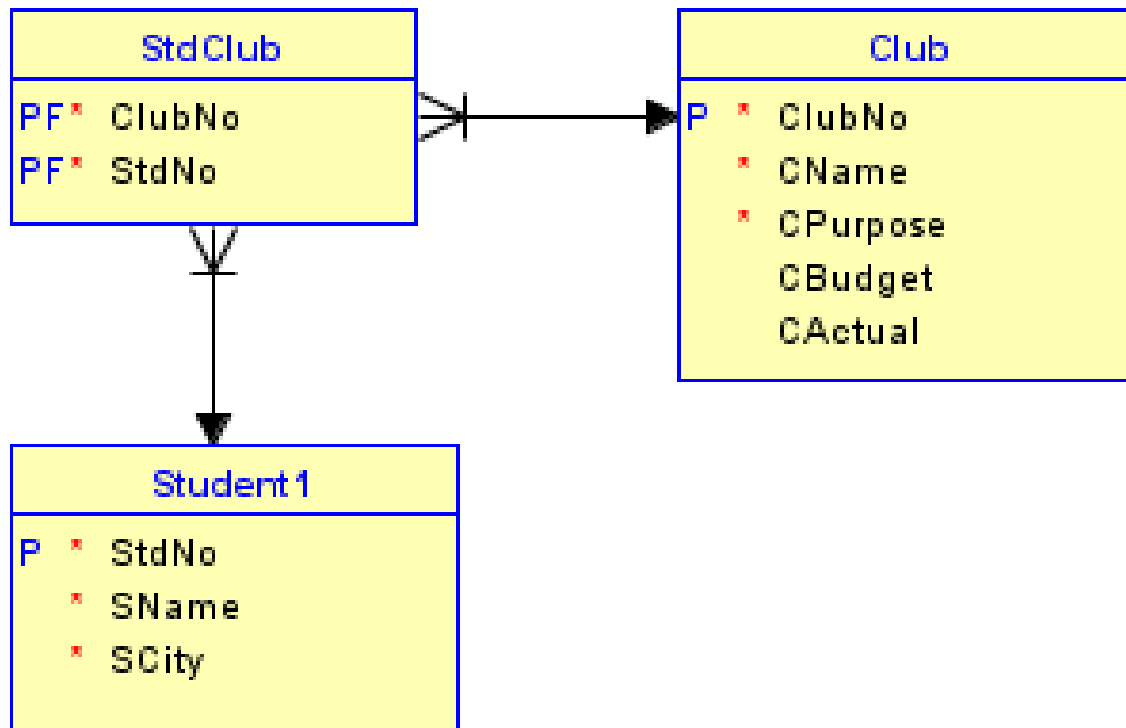

Apply the text pattern to detect problem statements with containment exceptions

Apply the statement pattern to write SELECT statements for containment exception problems

Write SELECT statements for basic and extended containment exception problems

Simplified University Database Diagram

Sample Rows in the Containment Exception Tables

Student1

StdNo	SName	SCity
S1	JOE	SEATTLE
S2	SALLY	SEATTLE
S3	SUE	PORTLAND

Club

ClubNo	CName	CPurpose	CBudget	CActual
C1	DELTA	SOCIAL	1000.00	1200.00
C2	BITS	ACADEMIC	500.00	350.00
C3	HELPS	SERVICE	300.00	330.00
C4	SIGMA	SOCIAL	[null]	150.00

StdClub

StdNo	ClubNo
S1	C1
S1	C2
S1	C3
S1	C4
S2	C1
S2	C4
S3	C3

Overview of the Containment Exception Problem

- Derived from relational division operator with subset matching
- Containment exceptions with most entities not matching a subset of entities
- Most customers do not order all suggested items in the same shopping cart.

Text Pattern

Containment adjective connecting prominent nouns

Every or all typical containment adjectives

Students who belong to all social clubs

Students who have taken every finance course

Count Statement Pattern

```
SELECT <ChildTableColumns> [, <RelatedTableColumns>]
FROM <ChildTable> [, <RelatedTables>]
WHERE [<JoinConditions>]
      AND [<ChildTableConditions>]
      AND [<RelatedTableConditions>]
GROUP BY <ChildTableColumns>,
         [<RelatedTableColumns>]
HAVING COUNT (*) =
      ( SELECT COUNT (*)
        FROM <ParentTable>
        [ WHERE <ParentTableConditions> ] );
```

Basic Example

Example 1: List the student number of students who belong to all clubs.

```
SELECT StdNo
FROM StdClub
GROUP BY StdNo
HAVING COUNT (*) =
    ( SELECT COUNT (*) FROM Club );
```

StdNo
S1

Extended Example

- Compare student club membership to an interesting subset of Club rows using identical conditions in the outer and nested queries
- Add columns of a related table

Example 2: List details of students who belong to all social clubs.

```
SELECT Student1.StdNo, SName
FROM StdClub, Club, Student1
WHERE StdClub.ClubNo = Club.ClubNo
      AND StdClub.StdNo = Student1.StdNo
      AND CPurpose = 'SOCIAL'
GROUP BY Student1.StdNo
HAVING COUNT(*) =
( SELECT COUNT(*) FROM Club
  WHERE CPurpose = 'SOCIAL' );
```

StdNo	SName
S1	JOE
S2	SALLY

Advanced Example

- COUNT(DISTINCT ...) to eliminate duplicate courses
- Using the original university database tables

Example 3 : List the number and the name of faculty who teach at least one offering of all fall 2019, IS courses.

```
SELECT Faculty.FacNo, FacFirstName, FacLastName
FROM Faculty, Offering
WHERE Faculty.FacNo = Offering.FacNo
      AND OffTerm = 'FALL' AND CourseNo LIKE 'IS%'
      AND OffYear = 2019
GROUP BY Faculty.FacNo, FacFirstName, FacLastName
HAVING COUNT(DISTINCT CourseNo) =
( SELECT COUNT(DISTINCT CourseNo)
  FROM Offering
  WHERE OffTerm = 'FALL' AND OffYear = 2019
    AND CourseNo LIKE 'IS%' );
```

10

Summary

Subset matching related to the relational division operator

Most entities not matching an interesting subset of rows

Text pattern with containment adjective connecting prominent nouns

COUNT statement pattern with a Type I nested query in the HAVING clause

Other statement patterns but more complex
